Remote Access Guide

Purpose

This guide explains how employees should access company systems when working remotely.

Approved access

Employees must use company-approved remote access methods and their assigned company account. Unapproved remote-access software must not be installed.

Multi-factor authentication

Where multi-factor authentication is enabled, employees must use the approved authentication method. Authentication codes and approval requests must not be shared with another person.

Company devices

Employees should use company-managed devices for access to company systems. Lost or stolen devices must be reported as soon as possible.

Public networks

Employees should avoid accessing sensitive company systems through untrusted public networks. Where remote access is necessary, employees should use the company's approved secure connection.

Security incidents

Suspected account compromise, phishing, unauthorised access, or lost devices must be reported to IT immediately.
